

## Module 10

Creating an entire website is a challenge, but a fun one. My landing and “Resume” pages are the only two that are fully finished. The “Resume” page was easy to make because it is simply linked to a PDF of my resume. The landing page, however, was much trickier. The HTML in order to create the navigation bar was basic and easy to code. The necessary CSS code in order to get the bar to look how I wanted it to was extremely complicated and sensitive. I wanted my navigation bar to look like buttons, be centered, and have a hover effect. It probably took me four hours to just achieve this. Once I did it though, I felt extremely accomplished. My “contact” page is currently the one I have been working on. I have most of it finished, but I need to lower the navigation buttons, which I have been yet to figure out. I want a similar blue print for my “About” page so once I finally figure it out, I am hoping to just copy the coding of the navigation bar and paste it in. Instead of the same image as my landing page, I am considering doing just a grey background for my “About” and “Contact” pages as well. Although I am not finished, I have learned how important it is to keep each pages CSS and HTML organized. It is already such a complicated and involved process, I cannot even imagine trying to code correctly and achieve my desired final product if my files were disorganized. Furthermore, an unorganized file system, especially for CSS, could result in me accidentally altering something on a different page, making a mess of my website. Although coding my website can be frustrating, I have loved watching it come together, and find it absolutely fascinating how simple code can result in such a colorful and aesthetically appealing design.
